音频鉴伪挑战赛

团队:起飞

成员: 白吴斌(毕业于加州大学戴维斯分校)

涂修建(上海优也信息科技有限公司)

基本思路

- Stage 1: Train on real/fake, test on real/fake
- Stage 2: Train on speakers(52), test on speakers
- Features: melspectrograms -> pictures(saves storage, much faster)
 - 滑窗: 窗口2s
- Models: CNN

Features: melspectrograms

- •使用 librosa.feature.melspectrogram 方法从音频中提取得到melspectrogram特征,划窗长度选择2s。
- 考虑到提取的特征矩阵中数值为float类型,存储和训练时占用很大的硬盘和内存空间,将之转换为uint8的图片格式,图片大小是(47,128),空间占用大大降低,也便于使用resnet等图片处理的模型训练。

Model

- Model :
- Basic Building Block: Conv2D -> BatchNormalization -> Activation -> MaxPool2D
- Stack of t hese: model 2: around 7-8 layers of stacks of CNN
- model 1: simpler, 2 layers less.
- Conv2D: differ in stride and kernel size
- Accuracy/Validation Accuracy: 99%+

Prediction

sample1_1 proba

sample1_2 proba

sample1_3 proba

sample1_4 proba

sample1_5 proba

. . .

sample1_x proba

- 1. 取mean
- 2. 取argmax

sample1 result

谢谢大家 Q&A
